

CONV

PRODUCT INFORMATION

C2300 is an early group II conventional with plants that are medium statured and exhibit intermediate branching.

- An early group II conventional that gives growers a top performing agronomically sound choice for this maturity.
- Excellent emergence, plant vigor and standability.
- Solid defense with protection against PRR, IDC, WM and SDS, with resistance to the Soybean Cyst Nematode.
- Widely adapted to soils and planting regimens with height being maintained under stress.

MANAGEMENT TIPS

Conventional herbicides can diversify weed control modes of actions in a farming operation. Height is maintained under stress. Widely adapted to soils and planting regimens. Top performance in any row spacing.

9 = Excellent 1 = Poor N/A = Not Available

GDUs are estimates based on observations and are to provide guidelines for area adaptation. Performance may vary from location to location and from year to year, as local growing, soil and weather conditions may vary. Growers should evaluate data from multiple locations and years whenever possible and should consider the impacts of these conditions on the grower's fields. Preferred Placement Zones represent the best areas of adaptation for a product based on in-field observations, genetic background, and trial data. Products may fit within only a portion of a zone, and products may perform well in other areas not identified. Contact your sales team for details.
